## Bridging the knowledge and skills gap in dairy husbandry

Smallholder dairy production in Kenya has been identified as a key pathway to food and income security by the government. However, there is a lack of adequate knowledge and skills for effective milk production. In the context of the Green Innovation Centres for the Agriculture and Food Sector Programme of GIZ, 1,400 smallholder farmers in Western Kenya were trained in several husbandry-related practices. Our authors analysed the impact of the training programme.

By Chrilukovian B. Wasike, Caroline C. Wambui, Joan Awino and Ulrich Schmidt

Smallholder dairy production units account for over 80 per cent of total milk produced and marketed in Kenya (MoLD, 2010). Past efforts have been geared towards transformation of these units into market-oriented dairy production in line with key national policy development agenda items. Despite these efforts, the sector is still faced with a myriad of challenges at the primary production level, especially the knowledge and practical skills gap in general husbandry practices, which undermines milk production (SNV, 2013; Ojango et al., 2019).

On behalf of the Green Innovation Centres for the Agriculture and Food Sector (GIAE) programme of Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ), GFA Consultants is implementing a dairy value chain component aimed at increasing productivity and income from smallholder dairy farmers in selected counties of Western Kenya, through innovations and alleviating technical challenges. The programme aims at bridging

knowledge and technical skills gap in dairy husbandry practices. Four training modules were developed and used for training: “fodder production”, “feed formulation”, “feeding the dairy cow” and “calf rearing”. This paper assesses the impact of the training programme on elevating technical competencies in smallholder dairy units and technology adoption.

### Questionnaire survey and data analysis

A total of 1,400 smallholder farmers were trained in Bungoma, Kakamega and Siaya counties of Kenya on the four topics using a four-topic by four-day training cycle approach in May 2018. These farmers were evenly distributed in 27 sub-counties of the counties with a near parity gender participation of 52 per cent male and 48 per cent female. A questionnaire survey was carried out six months later, by randomly sampling 432 trained smallholder dairy farmers proportionately distrib-

uted among the three target counties. The questionnaire captured: a) innovations in the training content, b) its adoption, c) qualitative and quantitative evaluation of impact on farmers, d) comprehension of training content and e) other socio-economic benefits of training in addition to suggestions for improvement of future trainings. Data obtained was subjected to descriptive statistical analyses of frequency counts, percentages and means to determine the level of adoption, limitations to adoption and the impacts thereof.

### Impact of training on smallholder farmers' husbandry practices

#### Fodder production

This training module entailed varieties of fodder crops, their propagation, harvesting and conservation. The participants in fodder production training comprised farmers who had no knowledge at all (2.8 %) as well as those

who were highly knowledgeable (9.6 %). All the ten topics delivered during training on fodder production except one (multi-purpose trees – MPT) had new lessons/ innovations for the producers. A respective 43.3, 33.5, 31.9, 25.2 and 20 per cent of the producers learned new concepts on new varieties (VAR), conservation (CONS), establishing fodder plots (PLOT), stage of harvesting (STAGE) and propagation (PROP).

Other concepts such as silage (SIL), hay (HAY), planting using the Tumbukiza method (TUM) and harvesting were fairly familiar to producers, with fewer than 20 per cent of producers viewing them as innovations. Adoption of innovations was highest in PLOT (65.6 %). Adoption levels above 20 per cent were also reported in VAR, PROP, STAGE, CONS and TUM innovations. The biggest hindrance to the implementation of innovations, especially silage making, on farms was the availability of material (MAT), which accounted for 41 per cent of non-implementation (see Figure).

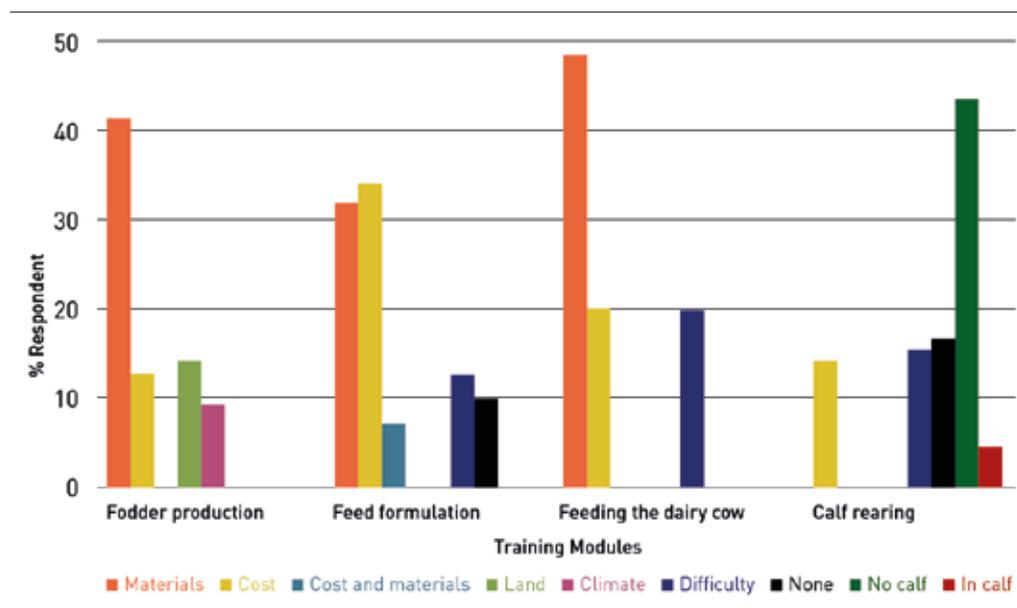

**Feed formulation**

This module comprised calculation and formulation of rations to provide a balanced and nutritive ration. Feed formulation was a fairly new concept, with 20 per cent of participants having had their first interaction with it during trainings. Only 4.4 per cent of participants had knowledge of all aspects of the feed formulation module. Calculations (CALC) was the concept least known to participants, with 56.7 per cent of them viewing it as new. Over 20 per cent of participants considered Formulation (FORM), Composition (COMP) and Ingredients (ING) as innovations. Formulation (FORM) had the highest adoption and non-adoption proportions of 29.8 and 23.2 per cent, respectively (see Figure).

**Dairy cow feeding practices**

Emphasis here was on dairy cow husbandry and feeding at different stages of development and lactation. Concepts of feeding dairy cows were fairly well known to training participants with only 16.1 per cent of producers perceiving all the content taught in the module as new. Challenge feeding (CHF), total mixed ration (TMR) and weight-based feeding (WBF) were new innovations to over 40 per cent of participating farmers. What to feed when (WFW) and Categories/ type of feed (CAT) were new to 18 per cent of participants, while wilting (WIL) and performance-based feeding (PBF) were not new to any farmer. Total mixed ration (TMR) concepts of cow feeding had the highest adoption rates (40 %), followed by CHF (29 %), WBF (27 %), WFW (27 %) and

**Hindrances to adoption of various training modules on the farms**

CAT (22 %). Only 1.6 per cent of participants adopted all the concepts, while 17 per cent of participants did not adopt any of the innovations. Adoption of concepts was hampered mainly by the availability of materials (MAT; 48.3 %), difficulty of the topic (DIFF; 20.1 %) and cost of inputs (COST; 20.1%) (see Figure).

**Calf rearing**

The focus here was on pre and postnatal management to avoid losing the calf and to guarantee a highly productive adult cow. Preparation of the cow in late lactation through steaming up (PREP), the importance of colostrum (COLO), the amount of milk fed according

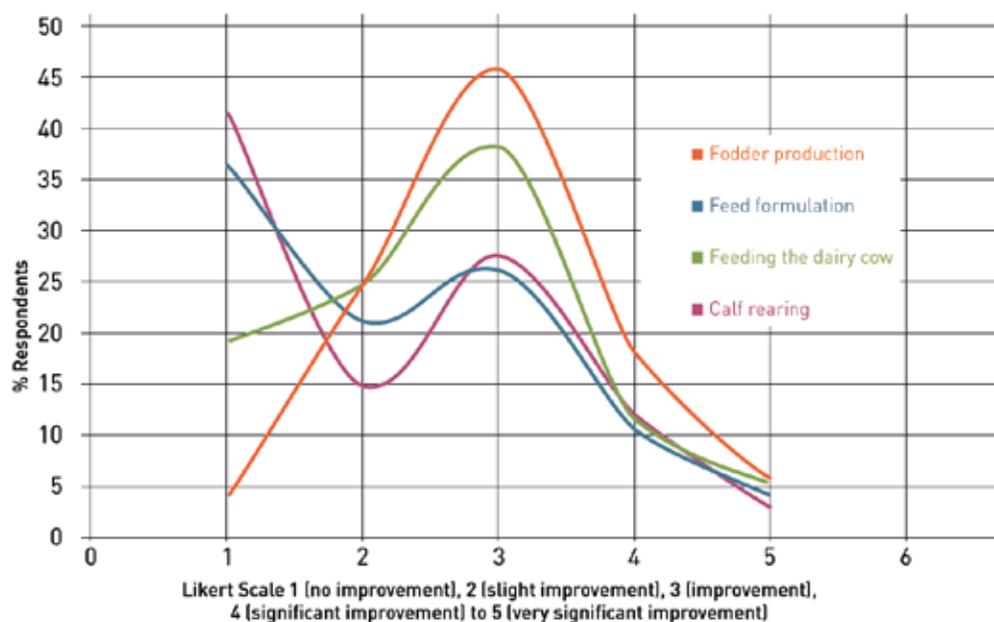

to growth (MILK) and the weaning of calves (WEAN) were new concepts to a majority of training participants who took part in the calf rearing module. 10.3 per cent of participants had no knowledge of rearing calf cows/ heifers. On the other hand, concepts delivered were not new to 12.4 per cent of participants of training. Helminth control was the most widely adopted innovation by 29.6 per cent of participants. Other innovations adopted included PREP, COLO, WEAN and MILK at a respective 25.9, 25, 20.2 and 17 per cent.

A large proportion of participants in the training (37.4 %) did not put into practice the

**Quantitative impact of dairy husbandry training on production**

Training module	Measured production impact	Rate of change		
		Unit change	% of farmers	
Fodder production	Increased milk production	1–4 litres/day	90 %	
		Increased acreage of fodder plots	0.5–0.7 acres	70 %
		Increased number of bales of hay	Up to 10 bales	34 %
	Up to 50 bales		34 %	
	Up to 250 bales		32 %	
	Increase in amount of silage	10–200 kg	23 %	
250–1,200 kg		36 %		
2–18 ton		41 %		
Feed formulation	Increased milk production	0.5–1 litre/day	16 %	
		2–4 litres/day	70 %	
		4–5 litres/day	14 %	
	Reduction in feeding costs	20–40 KES	16 %	
		100–230 KES	23 %	
		250–750 KES	24 %	
Feeding dairy cow	Increased milk production	800–1,750 KES	37 %	
		0.5–1.5 litres/day	50 %	
		2–4 litres/day	15 %	
		4–6 litres/day	18 %	
		> 6 litres/day	17%	

## Qualitative impact of dairy husbandry training on production

concepts they learned. This was primarily due to the participants not having calves on their herds at the time of training (40.4 %) and difficulty in implementing the innovations, e.g. weighing of the animals to calculate the amount of milk to feed.

### Constraints to adoption of training modules

Adoption rates of training content by farmers were at a respective 64, 37, 43, and 39 per cent for fodder production, feed formulation, dairy cow feeding and calf rearing modules respectively. Consequently, the fodder production module was the most adopted of the four modules of training. This was corroborated by a respective 77, 69, 66 and 67 per cent average comprehension of training content for the four training modules. Apart from comprehension of content, other factors influencing the rate of adoption of the module content taught included availability of material, cost of material, land, climate (weather), and difficulty/complexity of content. Availability of material (MAT) and cost of material (COST) were the main hindrances to adoption of module contents, except for the calf rearing module (see Figure on page 42).

### Impact assessment of training modules by farmers

The training resulted in an increase of up to 0.7 acres of land surface under fodder production per farm among 70 per cent of trained participants. Consequently, there was increased milk productivity (up to 4 litres/day), and farmers

explored conservation of fodder by baling hay and ensiling. An increase of up to 50 bales of hay was reported by 34 per cent of participants, while 41 per cent of respondents reported an increase in silage output from 2,000 to 18,000 kg.

Farmers also earned extra income from the sale of fodder (up to 4,500 Kenyan Shillings, KES), and formulated feed rations at farm level. An increase in daily milk yield of up to 4 litres and a reduction in feed costs of up to KES 1,750 was reported respectively by 80 per cent and 37 per cent of farmers who adopted on-farm feed formulation. The main impact of improved feeding of the dairy cows was increased milk production (see Table).

Cumulatively, about 95, 80, 63 and 58 per cent of participants realised improvement respectively as a result of training on fodder production, dairy cow feeding, feed formulation and calf rearing (see Figure above). However, more than 35 and 40 per cent of participants respectively did not realise any improvement

Feed resources for training on preparation of TMR.

as a result of training in feed formulation and calf rearing.

### Key lessons and policy orientation

The following conclusions can be drawn from the surveys:

- Smallholder dairy producers have the ability to apply technologies that enhance productivity of their farms if they are comprehensible, practical and within means to implement; thus training is a key component in availing new technologies to the farmers.
- The organisation of training (theory vs. practical, use of materials within easy reach of the trainees) and complexity of the content have an influence on technology adoption. More complex content such as feed formulation may require more training sessions with more practical sessions and relatively longer grace periods for adoption.
- Given the role that the smallholder dairy sector plays in the country, one has to distinguish small-scale farming households based on potential and incentive to invest in increased production in order to tailor, make new and repackage existing farm-level technologies to suit each group.
- With improvement in productivity, there is also a need to focus on enhanced efficiency of production and post-production segments of the value chain. Therefore, further trainings focusing on efficient breed (matching breeds to production resources) and feed utilisation, disease control, artificial insemination, agribusiness and value addition (milk processing) are needed.
